Gauges + Applications

0.08mm Satin | Matte | Codemark

Great for die-cutting, this foil thin gauge forms well to rough or curved surfaces for adhesive performance. The perfect on-site marking solution, 0.08mm can be de-bossed to leave a permanent mark - a date, a model, a rating, anything! The low profile makes this a very difficult label to remove - ideal for tamper-evident asset registration and bar coding.

0.13mm Satin | Deadsoft

A tough general purpose gauge with lots of flexibility, yet good resistance to rips and scuffs. Low temper Deadsoft has the properties of aluminium, but it bends like lead so will not 'ping' away from a curved surface.

0.20mm Satin | Matte | CodeMark

For the budget conscious the lightweight but robust 0.20mm offers the lowest prices, but retains all the durability.

0.30mm Satin

General purpose gauge well suited to business cards, award plaques and other promotional items. Engraves well, readily forms to a gentle curve, and is able to have punched holes for mechanical mounting.

0.50mm Satin | Matte | CodeMark | TagMark

Our most popular gauge for ID and rating plates. Variable info can be stamped by you on site or use our EngravaPlate service. Printable both sides for service and calibration tags, or even Dog Tags for your next team building exercise.

0.80mm Satin | Matte | CodeMark

Brilliant for self-supporting control panels or fascia with holes cut for inserts. Stays flat when fixed with rivets or screws for maximum security. Recommended for signs and plaques and labels where impact damage or vandalism is a risk.

EngravaPlate | Marking and Engraving Services

Our Plate Engraving Service is the easy way to add serial numbers and weight capacities to your pre-printed plates. No more running out of plates, we'll guarantee supply in 2-3 days. Simply email us the information to be marked.
